

Short description

aiContactSafe Module is a native Joomla! 1.5.x module developed by Algis Info. It offers the possibility to place the contact form generated by [aiContactSafe](#) component in any template position.

Warning : You need aiContactSafe 2.0.5 (or newer) to use this module.

If you use [aiContactSafe](#) , please post a rating and a review at the Joomla! Extensions Directory.

Installation

It's working only on Joomla! 1.5.x (1.5.10 or newer is recommended) in native mode. The module is no longer available for separate download. It can be installed from the control panel of aiContactSafe. Find the line "aiContactSafe Module" on the bottom of that page and click the "Install" button.

Configuration

From the parameters of the module you can select the position of the template to publish it and modify it's parameters.

Module Class Suffix - lets you modify the class of the tag displaying the module for an easier CSS coding.

Select profile - lets you specify which profile will generate the contact form

Profile's CSS - activate or deactivate the profile's CSS

Fields values - set the value of any of the fields in the contact form. You can use something like "aics_name=Alex Dobrin|aics_subject=Test message" for this parameter.

This will set the value of the field aics_name (default field used as the name) to "Alex Dobrin" and the value of the field aics_subject (default field used as the subject) to "Test message". You can set any of the fields in the contact form to any value you need. Just make sure all the fields are separated by a vertical bar (|).

Please report any bugs or suggestions to our forum.
